# Clock timer alarm

(Regular and old customer can pay 70% balanced after shipping goods, for details, please contact with our sales. 2. Our sales team is crazy and always keep 24 hours online, so all your emails will be answered in 24 hours. Besides starting it to the finished command, just keep in touch with one sales, she/she'll follow your order all the time. Descriptions: 100% brand new and high quality. Digital four channel timing and w/four independent color countdown clock: white 12 hour hour view hour. Countdown of up to 99 hours 59 minutes 59 seconds (99:59:59) timing at a time: four independent timers (T1-T4) perform countdown operations at the same time different beeper tones for each start/stop button 1 minute magnetic alarm clip back and stand easel. Powered by 2 × LR44 battery button (not included) Dimension: 92 × 70 × 12 mm packaging and charging packages: 1 xCountdown first timer, accurately introduced, 1000pm timer is also part of posix timer, consisting of two types CLOCK_REALTIME_ALARM CLOCK_BOOTTIME_ALARM. Add CLOCK_REALTIME CLOCK_BOOTTIME, respectively_ALARM. The POSIX timer stops off the timer when the kernel enters the ccuuidle or pauses because it saves power and shuts down the BlockEvent. With the help of the long power supply of the RTC device and alarm function, the timer flag writes the deadline ending to the RTC device while the system enters the suspended, which awakens the system from a suspended state and performs the function of a supermarket timer. This way, there is no need to hold wakelock all the time during the implementation of the program. Second, rear introduction can be said alarm timer to work in two states, one is the same as another hrtimer-based timing; After the trigger learned, the suspension system woke up by interrupting. At device_initcall >alarmtimer_init, sign up for the alamtimer platform_device, which is led by alarmtimer_driver. Insert alarmtimer_suspend the system's suspend process as a binding function, which binds suspend edits and Alamy Timer. Third, alarm_base important data structure such as the AlamTimer clock type structure ALARM_REALTIME ALARM_BOOTTIME two types. The static structure alarm_base {spinlock_t lock; ---------- the exclusive access of the mutual build lock timerqueue_head timer; ------- AlamTimer keeps the red and black tree finished itself. struct hrtimer time hrtimer_bases ----------; ktime_t (*gettime); ---------- to get a time job of the opposite type clockid_t base_clockid; ---------- the CLOCK_REALTIME CLOCK_BOOTTIME alarm_bases ALARM_NUMTYPE watch type ID. البنية k_clock alarm_clock作为两种类型共用的نعاس/الموقت函数: k_clock alarm_clock البنية = { .clock_getres = alarm_clock_getres، .clock_get = alarm_clock_get، .timer_create = alarm_timer_create، .timer_set = alarm_timer_set، .timer_del = alarm_timer_del، .timer_get = alarm_timer_get، ن ن = alarm_timer_nsleep، }بنية ثابتة ؛ rtc_timer rtctimer;----------RTC توقيت البنية الثابتة rtc_device *rtcdev;----------RTC设备对应的结构体 البنية rtc_time是RTC设备表示的الوعائي间格式: 1 بنية rtc_time {2 int tm_sec; 3 tm_min4 ؛ tm_hour 5 قيد tm_mday 6 قيدي tm_mon 7 قيد التنفيذ؛ tm_year 8 قيد التنفيذ؛ tm_wday 9 قيد التنفيذ؛ tm_yday 10 قيد التنفيذ؛ tm_isdst البنية ؛{ 11 قيد التنفيذ؛ ktime_t是内核。 سترو间格式. 这两种。 间格式的转换rtc_time到ktime_t过rtc_tm_to_ktime;ktime_t到rtc_time بورز过rtc_ktime_to_tm. 四正常工作状态 إنذار|运行 __init alarmtimer_init البنية } (الفراغ) ثابت platform_device *pdevخطأ ؛ int = 0؛ int i؛ k_clock alarm_clock ----------} = البنية الرم---Time的نوم/مؤقت/كلوك函数。.clock_getres = alarm_clock_getres، .clock_get = alarm_clock_get، .timer_create = alarm_timer_create، .timer_set = alarm_timer_set، .timer_del = alarm_timer_del، .timer_get = alarm_timer_get، alarm_timer_nsleep، alarmtimer_rtc_timer_init rtc_device的 将其加入 rtc_timer个 ----------初始化红黑树里面 posix_timers_register_clock(CLOCK_REALTIME_ALARM، alarm_clock)؛---填充posix_clocks [MAX_CLOCKS]的_ALARM部分 posix_timers_register_clock (CLOCK_BOOTTIME_ALARM، alarm_clock)إنذار الإنذار تهيئة قواعد * / ؛ */ alarm_bases [ALARM_REALTIME].base_clockid = CLOCK_REALTIME;---------初始化 alarm_bases [ALARM_NUMTYPE] alarm_bases[ALARM_REALTIME].[ الـ وقت gettime = &ktime_get_real; alarm_bases [ALARM_BOOTTIME].base_clockid = CLOCK_BOOTTIME؛ alarm_bases [ALARM_BOOTTIME ktime_get_boottime]. لـ (i = 0; i < ALARM_NUMTYPE; i++) { timerqueue_init_head(&alarm_bases[i].) spin_lock_init(&alarm_bases[i].lock); hrtimer_init(&alarm_bases[i]., alarm_bases[i].base_clockid، HRTIMER_MODE_ABS)؛ alarm_bases [i].timer.function = alarmtimer_firedخطأ { ؛ = alarmtimer_rtc_interface_setup()----------获取系统的strutrus rtc_device设备,给rtcdev| خطأ الإرجاع; خطأ (خطأ) إذا = platform_driver_register (&alarmtimer_driver)----------注册alarmtimer_driver主要就是钩الشرح函数 (خطأ) إذا) out_if؛ pdev = platform_device_register_simple (alarmtimer ، -1 ، NULL ، 0) ، - 注册الـarmtimer设备。 إذا (IS_ERR(pdev)) خطأ = PTR_ERR(pdev)؛ out_drv ؛غوتو } ws = wakeup_source_register(alarmtimer))----------返回注册的مصدر الوايكيوب، alarmtimer_suspend使用 ؛0 العودة out_drv: platform_driver_unregister (&alarmtimer_driver)؛ out_if: Error in return; AlarmTimer is a k_itimer member of the structure k_itimer: ... Union {... Structure {struct alarm; ktime_t interval;/ alarm; structure rcu_head rcu; The structure alarm is as follows: the structure of ----------ALARM_REALTIME ALARM_BOOTTIME the alert structure timerqueue_node node alarmtimer_type --- ktime_t alarmtimer_restart ----------; ----------#define ALARMTIMER_STATE_INACTIVE 0x00#define ALARMTIMER_STATE_ENQUEUED 0x01.#define ALARMTIMER_STATE_CALLBACK 0x02void* data;}; After understanding the configuration and data infrastructure of Alamtimer, such as the POSIX timer, focus on the functions available k_clock the structure. 1. AlarmTimer alarm_timer_create basically fills the current timer alarm structure: alarm_timer_create fixed int (k_itimer new_timer s) s alarmtimer_type type number; alarm_base structure* base; if (alarmtimer_get_rtcdev)) ---------- available RTC return-ENOTSUPP; if (is it able CAP_WAKE_ALARM)) ---------- the current process CAP_WAKE_ALARM capabilities and requires root permissions. Return -EPERM; Type = 2alarm (new_timer-it_clock); ---------- can be converted from temporary alarm_base to file. Rule = & alarm_bases[type]; alarm_init (&new_timer-alarm.alarmtimer, type, alarm_handle_timer); ----- the current temporary structural alert structure configuration with 0 returns; After filling the structure, the set ends and the hour begins. Constant int alarm_timer_set (k_itimer structure* timr, int signals, itimerspec structure *new_setting, itimerspec structure *old_setting) { ktime_t XP; if (!rtcdev) returns -ENOTSUPP; If (flags and ~ TIMER_ABSTIME) return -EINVAL; if (old_setting) alarm_timer_get (timr, old_setting); / * If the timer has already been set, cancel this time * / If (alarm_try_to_cancel (&timr->it.alarm.alarmtimer) < 0) Returns TIMER_RETRY; / * Start timer * / timr->it.alarm.interval = timespec_to_ktime (new_setting-gt;it_interval); --------- exp-timespec_to_ktime interval (new_setting-gt;it_value); ---------- the value of the first time out /* convert (if necessary) to absolute time / If (tags!?
