As winter is quickly approaching, there are a few calls we as a water district commonly receive that could potentially be avoided. Attached you will find a quick checklist of common issues we run across in the winter months that seem to be the cause of these call outs. By using this checklist and making sure these few things have been implemented could reduce the risk of potential water interruptions to your service or potential leaks.

Winter Checklist to prevent possible water leak issues

1. Turn off irrigation valve and blowout sprinkler systems.
2. Insulate and cover or remove any above ground back- flow assemblies
3. Remove any hoses from outside hose bib connections
4. If water line to house is same area as your cold air return, or attached to concrete wall, insulate water line to prevent freezing
5. Where applicable, allow snow to accumulate on water meter vault. Snow is a natural insulator and will aide in the prevention of your meter freezing.
6. If meter is next to your driveway, please ensure that the metal lid is flush and ground level. Take precaution when plowing that the lid does not become removed from the meter vault.
