Cisco webex meetings sign in

It's the stuff of nightmares. You've prepared for an important videoconference. You have slides and thoughts together ready, and you click to join (or start) the meeting, but it doesn't work. Maybe the video's off, or the sound isn't quite right. You're left scrambling to solve problems while other participants wait. This nightmare scenario is why it's crucial to test Webex before you need it. You can test Webex by joining a test meeting or setting up a fake meeting to confirm that you have everything you need for a successful videoconference. Joining a test meeting ensures that you can use your computer or mobile device for a webex meeting. Webex is a proprietary videoconferencing system produced by Cisco. It offers videoconferencing via a web browser or via a webex application. If you don't regularly participate in Webex conferences, you may not need to complete a full webex download. You can join a meeting using your browser. If you're hosting a meeting, you can set up a meeting through a webex app or browser. In this case, you should test Webex through any option you plan to use to host the meeting. Cisco offers test meetings that give you the opportunity to test webex without clicking on the official link join the Webex meeting you received in your email. To join a test meeting, navigate to the cisco web browser test website. You will be prompted to enter your name and email. After you do this and click Join, you may be prompted to add an add-on to your browser to make it easier to access meetings. For example, if you're using Chrome, you might be prompted to download the Webex add-on for Chrome. You can download an add-on or click a link to launch a temporary app to join the meeting. No matter which option you choose, you'll need to open the download if it doesn't open automatically. The app will open your meeting test page. When the test meeting opens, it displays a screen that shows how it accesses your computer's audio and video. Adjust these settings as needed and click Connect. If everything works, then you're ready for your meeting. If they don't work, change the settings and try again. If you're hosting a Webex meeting, you'd rather test your setup as a host than as an attendee. To do this, you should set up a mock meeting with one or more willing attendees. Your first step will be to schedule a meeting. To do this, log in to Webex (via browser or app) and click Schedule. Set a date and time and invite your attendees. At or just before the scheduled meeting time, you'll need to start the meeting. To start a meeting, sign in to Webex and find a meeting in Upcoming meetings. Click Start and connect sound sound Video. Wait for your participants to join, and then start the test. During a mock meeting, test any webex elements that you plan to use during the actual meeting. If you plan to view file sharing or sharing, test these options. Make sure you can mute and unmute all participants. If you plan to record, take a test shot and make sure you can restore it reliably. If you're having any problems during a fake meeting, visit Cisco's Webex Support Center or contact Cisco Support. They can help you solve any problems by having a seamless, nightmare-free meeting. Cisco's collaborative business is evolving, with new leadership to take over and a new focus on artificial intelligence. The company recently announced that its Spark team messaging app will be rebranded and rolled into its Webex platform. And this week, according to Rowan Trollope - who has led Cisco's collaboration efforts since 2012 - he is leaving and will be replaced by Amy Chang, founder and CEO of Accompany, an artificial intelligence business intelligence startup acquired for \$270 million on Tuesday. Chang, a former Google employee, will resign from Cisco's board to become senior vice president in charge of Collaboration Technology Group. Together, we have a tremendous opportunity to further enhance AI and machine learning capabilities in our collaboration portfolio and continue to create incredible collaboration experiences for customers, Cisca CEO Chuck Robbins said in a statement. The move follows the decision to drop the Cisco Spark brand, which will become Webex Teams. The app will include all of Spark's collaboration features, including persistent messaging, whiteboarding, easy access to guests, and sharing content. Cisco has also launched a new webex meetings video conferencing app, which will replace Spark's meeting app. Spark video meetings

have previously operated independently of Webex, which is held in the public cloud rather than webex data centers. As a result of the changes, both Webex meetings and Webex teams will launch on the webex infrastructure backlash. IDC head of research Wayne Kurtzman said rebranding is not just about marketing. The fundamental shift is to include calls, meetings, video, collaboration and their in-room devices under what they consider their most famous brand, Webex, he said. The name change extends to all Spark products, such as the Spark Board digital board - which becomes the Webex Board - and the upcoming Spark Assistant AI feature will become a Webex Assistant. Cisco is talking about a voice-activated AI from last fall. The decision to merge Spark and Webex reflects Microsoft's decision to centralize its communication and collaboration tools around Teams and gradually house the Skype for Business brand. Cisco also promised to make it easier for customers to jump between Webex and other team teams tools that exist, with plans to integrate with Google, Slack and others. According to Jon Arnold, an independent analyst for J Arnold & Associates, there was quite an overlap between Spark and Webex. Merging the two products will help simplify the company's portfolio and take advantage of the well-established Webex brand. The decision to favor the Webex brand in favor of Spark is what the market knows, what the market understands and believes and is already used to paying money, he said. Webex is the one who makes money and that's important for Cisco. A more focused product portfolio will also use Cisco's partners. The channel has to sell these things and they already know how to make money with Webex, Arnold said. One of the reasons Spark has been slow to generate revenue is because it's a hard sell to the channel. The difference between team collaboration and meetings is kind of an industrial thing; I don't think people in the workplace think accordingly, he said. So this is part of the simplification route Cisco takes. Copyright © 2018 IDG Communications, Inc. Cisco added cloud calls to its Webex Teams messaging app - what the company called a significant step in integrating BroadSoft's technology bundle after completing this year's \$1.9 billion acquisition. The combination is designed to provide a business class-based PBX [private branch exchange] phone system in addition to existing messaging and document sharing features. For users, it simplifies things, said Zeus Kerravala, founder and chief analyst at ZK Research. BroadCloud Calling gives companies the benefits of PBX without the need for real implementation. Adding a reference to Webex Teams' content and messaging capabilities makes it a unique UC [unified communication] application, which was UC's theory-like vision, Kerravala said. Earlier this year, Cisco merged its two collaboration platforms - Webex and Spark - into one platform: Webex Teams. At the time, IDC research manager Wayne Kurtzman described rebranding as not just marketing. The fundamental shift is to include calls, meetings, video, collaboration and their in-room devices under what they consider their most famous brand, Webex, he said. At a Cisco BroadSoft Connections event in Florida on Tuesday, Cisco also unveiled a new call app that integrates with Microsoft Outlook and company directories. The Cisco Calling app gives users voice and video calls from mobile devices and desktops running iOS, Android, Windows, or MacOS. Huddle room hardware and software Cisco has also unveiled new devices aimed at improving the huddle space meeting experience - referencing research claiming to have more than 25 million of these rooms in offices around the world. Webex Room Kit Mini video conferencing device is aimed at smaller meeting rooms, adding to the existing Webex Room Kit range. The device wakes up when it detects users entering the meeting room and customizes the video to ensure that all attendees are visible on the screen. Meanwhile, a 55-inch. The Webex Board digital panel received a software update, with browser access, sticky notes and pinch and zoom interactions. For larger rooms, Cisco also launched an 85-inch version of the screen. Finally, the company released Webex Share, a wireless screen-sharing device that converts any TV or screen into a presentation device, connecting to Webex Meetings and Webex Teams. Kerravala said meeting room hardware can often be expensive and difficult to implement, thus limiting the technology to medium and larger rooms. Devices designed for smaller rooms should help expand the reach of video conferencing tools. There are literally tens of millions of assembly rooms and open spaces where there could be a TV or some other screen, but nothing, he said. Room Kit Mini and WebEx Share make it easy to turn any image into a smart collaboration space. Copyright © 2018 IDG Communications, Inc. Cisco plans to bring voice transcription to its Webex meeting tools by acquisition of Voice, part of a broader initiative to add AI capabilities to its collaboration software. Cisco announced today that it will acquire Mountain View, a CA-based company for an undisclosed amount. Voice's core product is its Enterprise Voice Assistant (EVA), a speech recognition tool that overwrites sound, providing highlights and action points for participants. The goal is to combine Voice's technology with Cisco's webex meeting tool, including its webex assistant voice assistant, which was developed after a \$125 million acquisition of conversational AI startup MindMeld in 2017. Webex Assistant allows users to start video meetings, make rooms available, and manage conference room hardware using voice commands. The capabilities are strong by combining transcription (EVA) and conversational engines for AI (Webex Assistant), said Sri Srinivasan, Senior Vice President and General Manager of Webex, in a blog post. Adding Voice technology will give users access to live transcription, as well as the ability to post meeting summaries, capture action items, and search for meeting notes. It will also be possible to channel meeting-generated information into business and collaboration applications such as Salesforce, Trello and Jira, Srinivasan said, thereby creating uninterrupted work pens. Voicea is currently integrating with a range of third-party videos including Zoom, BlueJeans and Google Meet. Regarding whether this type of support will continue, a Cisco spokesperson said via e-mail: At Cisco Webex, we invest in our integration travelogue with other collaboration solutions. One of our priorities is to make our world-class collaboration experiences available to our customers, regardless of productivity and other collaboration products they choose. Cisco will evaluate existing integrations at conferences and will continue to support them in line with our overall strategy. Irwin Lazar, vice president and analyst at Nemertes Research, called the acquisition a good move for Cisco as it builds on previous investments in AI's capabilities for Webex. Cisco also added facial recognition to automatically identify participants in the video meeting, which is part of his broader cognitive collaboration initiative. Within the meeting space, the primary cases of using AI are facial recognition, recording and processing tasks, and voice management of meeting apps. By purchasing Voice, Cisco now has opportunities in all three areas, Lazar said. While the use of voice technology in corporate settings is only now gaining traction, demand is growing. A recent survey of 645 companies by Nemertes Research found that 43.3% of them estimated or planned to implement AI-enabled collaboration software. Cisco is not alone in bringing AI into the conference rooms. Amazon's Alexa for Business focuses on a number of smart office usage cases, including implementing Echo devices in conference rooms, while Microsoft Teams integrates with its Cortana assistant and offers a range of AI features, including automatic transcription. Tim Banting, chief analyst at Ovum, said companies are increasingly aware of the potential for AI to strengthen collaboration and communication and are beginning to favor suppliers that offer such opportunities natively in existing applications. As more companies realize the benefits of incorporating AI into their communication and team collaboration activities, they will begin selecting suppliers offering AI-building platforms to their core platform, Banting said. However, most businesses are in the early stages of assessing AI despite promising to improve team productivity and reduced human latency. Image copyright © 2019 IDG Communications, Inc. Inc.
