XAPK files and how to install? Follow us page 2 Follow US ↑ Enter some text to welcome to InstaFonts.io! You can copy and paste these text fonts for use not only on Instagram bio, but also on the Internet! For example, using bold text that punctuates key points in a post can help draw attention to an important part of the reader (skimming is the new reading of the Internet age). Stylish text fonts like this website are also useful for attracting people's attentionPost/Tweet/etc. in the first place. Instafont was mainly designed to bring fonts for your Instagram bio, but we hope you too will be useful for other purposes! The keyboard has only about 100 characters, but it doesn't fit any more. There are actually tens of thousands of characters! Originally there were 128 characters (read about ASCII), but then Unicode was introduced to support unlimited character counts. Every year, the Unicode standard grows to incorporate more characters - and emojis! Well, there are a lot of characters than those on your keyboard, but how do we generate bold/italic/flashy text that can be copied and pasted into another thing away from this site? Some of these character sets were added for mathematicians, linguists, and other scholars who wanted to be able to represent formulas and express them by email (emails did not originally have text formatting), while other character sets were introduced in countries that required communication (for example, complementing full-width Latin characters). So that's how we ended up with all these funky text fonts. Of course, many of the above fonts are not proper character sets - they were grouped together in a set similar to the alphabet. Now to a long explanation: the long explanation begins with an international organization called Unicode. This is an organization that deals with international standards for converting numbers to text characters. Unicode was the solution to an increasingly important problem at the dawn of computing and the Internet: How does my computer communicate with another computer on the other side of the world if it speaks another language? ASCII was (and still is) a simple set of conversion rules for converting numbers to letters. The original ASCII specification contains 128 characters because 128 is the largest number that can be represented in 7 bits. But doesn't the computer tend to like 8-bit groups (i.e. bytes)? yes, but the eighth bit was used for code pages - that is, if used for domain-specific purposes, the other 128 characters (128 + 128 = 256 = the maximum number you can make from 8 bits). companies can use them for themSpecial encodings, or entire countries can use them for non-Latin characters in their language. However, there are many problems with this approach. First, many languages (such as Chinese) have more than 128 characters. Second, what if you want to be allowed to read and write documents that contain characters from two different code pages? We need more characters! and here comes Unicode to solve all our problems. In the early 1980s, a bunch of renowned computer scientists and engineers gathered to try to solve this very annoying problem. They invented encodings that were backward compatible with ASCII (absolute is necessary because no one wanted to rewrite all documents and programs to handle the new encoding). This means that the Unicode and ASCII specifications are actually exactly the same for the first 128 characters. Thus, a chain of Unicode encoded numbers representing Latin characters (or the first 128 other characters) can actually be read by programs designed to read only ASCII characters. However, if the Unicode text contains other characters (outside the range of 0 to 127), the ASCII reader cannot understand it. Now, how does this relate to Instagram fonts? This meant that for all the languages and purposes that everyone could hope for, tens of thousands of new characters would be introduced (including the modern needs of social media: emojis) and this led to the introduction of many characters resembling the usual characters visible on your keyboard, either by mistake or by design. Unicode has so many characters that more flashy text fonts are always discovered. You can simply browse unicode characters to find interesting characters that look like alphanumeric characters and build your own text font. Are they actually fonts? Fonts (or actually typed bodies) are the ones that apply to normal characters like the one you're reading right now. The font converts the style of the character, but does not change the actual character. So you can't copy and paste the text you're reading now to a social media website and expect the font to be transferred with the letters. However, copying this text actually copies the styles that those characters appear to have. Because, as mentioned earlier, these fancy characters are not the same characters to which a particular style was applied, but actually separate characters. The letters e and e are the same as S and 5. It may look similar, but it's a completely different character. Which fonts work with bio?Some of these fonts may not work properly on Instagram because they block certain characters from appearing in the BIOS. It's hard to keep track of which fonts are working and which ones are not working at any particular time, so we include all the fancy fonts and can be easily tested just by checking if they work in your bio. The same is the case if you're using these fancy fonts on Twitter, Tumblr, or amino, or discord, or absolutely anywhere else. Whether a font works depends on whether the platform developer has decided to ban font characters. Can these fonts be used on other social networks? You can use them on Twitter, Facebook, Tumblr, Reddit, Amino, Discord, Spectrum, WhatsApp, WeChat, YouTube, QQ, Snapchat, Skype, VKontakte (VK), Pinterest, Tariga, and more! There's a decent change that you can spice up your posts with these stylish text fonts. The site is called Instafont because Instagram is one of the most widely used social media platforms. As mentioned earlier, not all of these Unicode fonts work for all sites, as some sites do not allow certain Unicode characters. Give feedback to the feedback team. You can share it with us here. We will do our best to provide your suggestions to the website in the next update. Thank you for visiting Instafont! note: This homepage is actually just a placeholder. You'll soon be able to see more fonts - all designed by people like you using our flashy font maker! :) Privacy Policy Policy
