## How to fill color in ms word table

Please note: This article is written for users of the following Microsoft Word versions: 97, 2000, 2002, and 2003. If you're using a later version (Word 2007 or later), this tip may not work for you. For the version of this tip written specifically for later versions of Word, click here: Fill the color in the table. By Alan Wyatt (Last Updated June 26, 2018) April is a table in her word document. A row is formatted with a custom color fill to match the company's logo color. Fill the color for other rows that April now wants to copy. She was hoping to use the format painter, but she just copies the text format, not fill the color used in table cells. April wonders if there's a way to imitate the color filling from one row to another. There are some ways you can contact this problem. One simply is to use the tools available in Word. Follow these steps: Select the row that is already full of the desired color. Display table and border toolbar (click View | Toolbars | Tables and borders). Click the down-arrow to the right of the shading color tool on the toolbar. (The tool looks like a spread bucket of paint.) The word displays a palette of colors. Click more colors. The Word Color dialog box displays. (See Figure 1.) The color of the selected row should already appear in the dialog box. Figure 1. Color dialog box. Click OK. (Note that you didn't make any changes to the dialog box; you just clicked OK.) Select the other rows in the table whose background color you want to change. Click the Shading Color tool on the Table and Borders toolbar. Your desired color applies to the selected rows. After applying the desired color, if you want to apply it elsewhere (maybe in another table or in some cells you have missed), you just have to select the cells and press F4. Shading on selected cells is repeated. If you need to do this with multiple tables or in multiple documents, you may consider using macros to do shading. A simple little macro is the one below: Sub Shadetable() long dim forecolor as long as the backcolor if opting. Information (wdWithInTable) then with Selection.Tables(1) = backColor. Cell (1, 1), photography. BackgroundPatterncolor forecolor = . Cell (1, 1), photography. ForegroundPatterncolor. photography. BackgroundPatterncolor = Backcolor. Shading.ForegroundPatternColor = Forecolor & With Every MSGBox place the entry point in a table end if the end sub macro colors an entire table based on the shading used in the first cell of the first row of the table. All you have to do is make sure you place the entry point somewhere within the table before you run it. This macro is the variation of the macro mentioned on the following website: Note: WordTips cost effective Microsoft Word training Is your source for. (Microsoft Word is Popular word processing software in the world.) This tip (10931) applies to Microsoft Word 97, 2000, 2002 and 2003. You can find a version of this tip for the ribbon interface of Word (Word 2007 and later): Copying fill color in table. Do more in a short time! Are you ready to use the full power of Word 2013 to create professional documents? In this comprehensive guide you will learn skills and techniques required for your professional and your personal life. Check out word 2013 in depth today! Please note: This article is written for users of the following Microsoft Word versions: 2007, 2010, 2013, and 2016. If you're using an earlier version (Word 2003 or earlier), this tip may not work for you. For the version of this tip written specifically for earlier versions of Word, click here: Fill color in table copying. By Alan Wyatt (Last Updated December 30, 2017) April is a table in her word document. A row is formatted with a custom color fill to match the company's logo color. Fill the color for other rows that April now wants to copy. She was hoping to use the format painter, but she just copies the text format, not fill the color used in table cells. April wonders if there's a way to imitate the color filling from one row to another. There are some ways you can contact this problem. One simply is to use the tools available in Word. Follow these steps: Select the row that is already full of the desired color. Display the Home tab of the ribbon. In the paragraph group, click the down-arrow to the right of the shading tool. (The tool looks like a spread bucket of paint.) The word displays a palette of colors. Click more colors. The color of the selected row should already appear in the dialog box. (See Figure 1.) Figure 1. Color dialog box. Click OK. (Note that you didn't make any changes to the dialog box; you just clicked OK.) Select the other rows in the table whose background color you want to change. Click on the Shading Tool on the Design tab of the ribbon. Your desired color applies to the selected rows. After applying the desired color, if you want to apply it elsewhere (maybe in another table or in some cells you have missed), you just have to select the cells and press F4. Shading on selected cells is repeated. If you need to do this with multiple tables or in multiple documents, you may consider using macros to do shading. A simple little macro is the one below: Sub Shadetable() long dim forecolor as long as the backcolor if opting. Information (wdWithInTable) then with Selection.Tables(1) = backColor. Cell (1, 1), photography. BackgroundPatterncolor forecolor = . Cell (1, 1), photography. ForegroundPatterncolor. photography. BackgroundPatterncolor = Backcolor. = With forecolor end MsgBox colors an entire table based on the shading used in the first cell of the first row of the first row of the end sub-macro table if the end sub-macro ends the insertion point in a table. All you have to do is make sure you place the entry point somewhere within the table before you run it. Note: WordTips is your source for cost-effective Microsoft Word training. (Microsoft Word is the most popular word processing software in the world.) This tip (10932) applies to Microsoft Word 2007, 2010, 2013 and 2016. You can find a version of this tip for Word's old menu interface here: Copying Fill color in table. Comprehensive VBA Guide Visual Basic for Applications (VBA) is the language used to write macros in all Office programs. This complete guide shows both professionals and novices how to master VBA to customize the entire office suite for their needs. See mastering VBA for Office 2010 today! In this article, we will provide you five ways to quickly apply the filling color of the table cell to the whole row, column or table. You can see when you copy to table cell in Word, you only get cell contents but never fill color. So, we want to show you five functions to solve this problem. Method 1: Get the RGB value of table cell manually First, select the cell whose color you need to get. Next click the Design tab. Find the command below the shading and click the drop-down button on that command. Choose Borders and Shading to open the same name dialog box on the menu. Next in the Open box, click the Shading tab. Go to the Fill field and click the drop-down button. And select more colors to open the color box. Choose RGB for color model area. Get the RGB value below. Then close all the boxes and put the cursor inside the target cell. Or you can select multiple cells, rows, columns or even the whole table. Click the drop-down button on the shading command to select more colors. Enter the RGB value under the Custom tab and click OK. Method 2: The Open Formatting Reveal pane is the same idea to get the RGB value and then applies it to target cells, rows, columns, or entire tables. First, place the entry indicator inside the filled cell. Next press Shift + F1 to open the appearance formatting pane. And you will be able to see the RGB value of the cell under the shading section. Follow steps 9 to 11 in Method 1. Method 3: Apply a cell color to the whole table via VBA as subtitle suggests, here's how to unify the whole table in one color. To start, position entry indicator inside a colored cell. Press Alt + F11 to trigger the VBA editor. Next click the General Project and click the Insert tab. Then select the module on that menu. Open it with double click. And paste the following code there: Sub Dim nRowIndex as long as integer dim nColumnIndex as long as the integer dim nCellForeColor if selecting nCellBackColor. Notification(wdWithInTable) = true then nRowIndex = Selection.Cells(1).RowIndex nColumnIndex = Selection.Cells(1).ColumnIndex and MsgBox (please place your cursor inside a cell. ) Exit the sub-end with the selection. Table (1) nCellBackColor = . Cell (nRowIndex, nColumnIndex), photography. BackgroundPatterncolor = nCellForeColor. Cell (nRowIndex, nColumnIndex), photography. ForegroundPatterncolor. photography. BackgroundPatterncolor = nCellBackColor. Shading.ForegroundPatternColor = nCellForeColor Finally, click Run or hit F5. Method 4: Fill the color of a cell in the whole row through VBA at first, insert the cursor inside a cell. Next install and run a macro after exactly the same step in Method 3. Then replace the above with these codes: Sub ApplyOfOneCellToEntireRow() dim nRowIndex as long as integer dim nCellForeColor as long as nCellBackColor if selecting. Notice (wdWithInTable) = true then nRowIndex = Selection.Cells(1).RowIndex nCellBackColor = Selection.Cells(1), photography. BackgroundPatterncolor nCellForeColor = Selection.Cells(1). Exit the sub end with the Shading.ForegroundPatternColor Else MsgBox (please put your cursor inside a cell.) selection. Table (1). Rows (nRowIndex), Shading. BackgroundPatterncolor = EncebeBackColor. With ForegroundPatorcolor = Anselforcolor & Sub Method 5: Fill the color of a cell through the VBA potential through the entire column, first insert the cursor inside a cell. Then run by installing a macro properly. Replace the macro with this one: Sub applyColorOneCellToEntireColumn() dim nColumnIndex as long as integer dim nCellForeColor if selected. Info (wdWithInTable) = true if nColumnIndex = Selection.Cells(1).ColumnIndex nCellBackColor = Selection.Cells(1), photography. BackgroundPatterncolor nCellForeColor = Selection.Cells(1). Exit the sub end with the Shading.ForegroundPatternColor Else MsgBox (please put your cursor inside a cell.) selection. Table (1). Column (nColumnIndex), Shading. BackgroundPatterncolor = EncebeBackColor. ForegroundPatterncolor = nCellForeColor End with End Sub handle Word issues and there will always be problems in the process of using Word. So it is quite necessary to learn the right trick to deal with all these annoying issues. One of the measures you should take is to grab the Word Fix tool in advance. Then once the document is corrupted you will not be afraid.
