Photo: amazon.comThe average person flushes away 20 litres of water per day, which means that the average household can use more than 80 liters per day. Although most modern toilets consume much less than 3 to 7 liters as older toilets did, not all are as efficient as they could be. If you use an inefficient toilet, you can use more water and spend more on your monthly water bill than need to be. Dual flush toilets are a low-flush toilet option invented to address this problem. By providing one flushing option for liquids and another for solids, dual flush toilets use just the right amount of water to get the job done. Dual flush toilets come in several styles with varying features, so it's important to do your homework before shopping. If you want to discover which one is right for you, read on to learn how to choose the best double flush toilet for your bathroom. Photo: homedepot.comTypes of Dual Flush ToiletsBefore learning about the features that dual flush toilets have to offer, it's important to know about the different types. Each has its own set of advantages, so compare and contrast the different options to determine which type will work best for you. One-PieceA one-piece toilet has the tank and bowl combined into a single unit, as opposed to the more common two-piece toilet that has its tank and bowl separated. Although two-piece toilets are more common, one-piece toilets are becoming increasingly popular because of their unique advantages. For starters, toilets in one piece are easier to clean. Because they have fewer nooks and crannies than two-piece devices, there is less room for odor-causing bacteria and bacteria to hide. They also have a prettier design that can look better with a modern bathroom existing décor. A toilet's one-piece internal components, including flushing and filling valves, are also more robust and less likely to cause leaks and require repairs. Single-part toilets are usually heavier, harder to install and repair, and cost more. But the aesthetic appeal, ease of cleaning, and heavier nature can compensate for heftier weight and price tag. Two-PieceA two-piece toilet is the most famous design. It consists of two pieces: the bowl and the tank. The beauty of this design is that it is normally easier to move and repair than the one-piece variety. However, the readily available internal components of the tank are usually not as durable as a one-part part. A major advantage of two-piece toilets is that they come in more sizes and styles than a piece of toilets. This allows them to accommodate a wider range of internal design features and bathroom spaces. In addition, they are usually cheaper than a piece of toilets. Wall mountedPasteddedan one piece and two-piece both fall under the category of floor-mounted toilets, there is another option: options: Unlike a floor-mounted toilet that has its tank and flushing mechanism visible and exposed, a wall-mounted toilet has these components hidden behind a wall. This can save about 10 inches of floor space, which is helpful in small bathrooms. The bowl also hangs off of the wall, leaving open space underneath. This feature has the advantage of making your bathroom floor easier to clean and provides a liquid look that some prefer. Wall-hung toilets also give you the freedom to customize the height from floor to seat, allowing you to install it anywhere between 15 and 19 inches above the ground. They tend to be more expensive, harder to repair, and harder to install than their floor-mounted counterparts. Aside from whether a double flush toilet is wall mounted, one piece, or two-piece, there are several other factors to consider when choosing a double flush toilet. To ensure that you find the best toilet for your bathroom, keep the following considerations in mind. MaterialExpensive flushing toilets are usually made of porcelain or plastic. Porcelain is the most common material used in the production of toilets. This is because porcelain is sturdy, keeps a waterproof seal, and is relatively inexpensive to produce. Plastic toilets, on the other hand, are relatively rare because of the difficulty of producing a plastic that is of comparable quality to porcelain. Smart toilets, which come with features like heated seats, automatic flushing and night lights, are usually made of a highly resistant plastic. Unfortunately, it is much more difficult to incorporate the same bells and whistles into porcelain, so a plastic casing is required. The combination of smart functions with the material's inherent manufacturing system makes plastic toilets more expensive. Size and ShapeDual flush toilets are available with round or elongated bowls. Round bowls have the advantage of being more compact, by about 1 to 3 inches, and cheaper than their elongated peers. The compact nature of round toilets means they can better fit in smaller bathrooms and won't take up as much floor space. Since most building codes require 21 inches of floor space in front of the restroom to satisfy Americans with Disabilities Act (ADA) guidelines, you may need a smaller round bowl toilet to meet this code. Elongated toilets are generally considered to be more comfortable than the strictly round variety, and are slightly more expensive. The higher level of comfort makes elongated toilets the most popular type, and is why this shape is usually recommended for bathrooms that have room for the extra length. Flushing Mechanism Flushing Mechanism is what makes dual flush toilets truly unique. Most toilets use only one type of flushing to get rid of both solid and liquid waste, but double flushes are different. They have a flushing option for each. Flushing for liquids use about half of the water used for flushing solid waste. This nearly-a-gallon-per-flush amount can save hundreds to thousands of gallons of water per year. The dual flushing ability is possible due to a special flush valve that regulates the amount of water leaving the tank. While single flush toilets use a single operation flush valve that removes the entire contents of the bowl with each flush, the flush valve on a double flush toilet has special components. While the components may be slightly different for each toilet, they are designed to allow the tank to shed two different volumes of water. Water useFlute toilet accounts for almost 30 percent of the average household's water use. In other words, it is the primary source of a home's water consumption. Most healthy people discard liquid waste 3 to 4 times more often than solid waste, but use about twice as much water as is required to discard it. With a double flushing toilet, you can put a stop to using extra water. By using only 0.8 to 1.1 liters of water to flush liquids, you can save around 67 percent more water than if you used an older, standard toilet. Ultimately, this could be a 20 percent savings on your water bill.ComfortWhile longer elongated toilets are generally considered the most comfortable, height also determines comfort. A standard-sized toilet has about 14 1/2 inches between the floor and the toilet bowl rim. It can work well if you are an average height or slightly shorter, and it usually works for children. If you are particularly tall, have a disability, or are otherwise limited in your mobility, a higher toilet may be better. A toilet height of 17 to 19 inches, often referred to as comfort height, is designed for taller people and people with limited mobility because it requires less squatting and bending at the knees. Comfort height is also called the ADA standard because it is easier to use by people who have difficulty standing from a low position. StyleDual flush toilets come in a variety of styles that can accommodate a wide range of aesthetic flavors, including modern, contemporary, traditional, and transitional arrangements. Along with the other design features, whether a toilet is a one-piece, two-piece, or wall mounted also affects the look of your bathroom. Generally speaking, one-piece toilets have an elegant look that suits modern and modern bathrooms. Two-piece toilets, the oldest and most common style, are available with more design choices that can complement most interior design preferences. Wall-mounted toilets have a stylish and clean shape, and tend to fit in the style of modern and modern bathrooms. As far as colors are concerned, most toilets are only available in standard white. However, there are other colors available and each brand can have its own unique shade of white and Finish. Some offer white with a shinier finish or a softer, antique finish. Using the same brand throughout your bathroom helps avoid any color matching dilemmas. Photo: homedepot.com Not many people like to clean a toilet, but Toto's Aquia dual flush toilet can keep your cleaning days to a minimum. In addition to the fact that one-piece toilets are in themselves easier to clean, this device also has a skirt fold to inhibit the grime-attracting contours of the typically exposed trapway.
