Retro race car wheels

Jupiterimages/Comstock/Getty Images Even the most advanced cars on the road depend entirely on a simple machine: the wheel. Where proverbial rubber meets the road, the wheel structure and function make a car move smoothly from point A to point B and back. However, this important feature of the car comprises only a few simple parts that, despite differences in style or structure, provide essentially the same wheel-to-wheel functions. The outer cover of the wheel is called pneumatic. Typically made of rubber, tires provide padded support for car weight, traction control to move and stop, along with a replaceable barrier between the rim and the road. Tires come in a variety of shapes and sizes that depend on the type of car you connect them to. The section that comes into contact with the road, called the tread area, typically contains grooves and notches that increase friction or force water and debris away from the wheel. Tires are filled with pressurized air to provide cushion support; you should fill them at a certain number of pounds per square inch (psi) depending on the road surface, type of car and type of rubber used in the tire. Most car tires list the specifications on the wall (side) of the tire. The rim of a car's wheel is the skeletal body of the tire. It supports the rubber tire, which wraps around it, and houses the bucket. Typically made of strong metals such as steel and aluminum, car tires come in various shapes and sizes and can range from standard tires covered by plastic hubcaps to solid spinner rims that have free-turn metal accessories on the outside of the wheel. The width and diameter of the tire determine the size of the tire that can fit, although some tires are wider or narrower than the tire for which they are made. Custom wheel wheels provide accessories market color, style, and size options, but can cost much more to balance, overha over, or repair. The hub is the central part of the wheel that joins the entire wheel to the axle and braking system. The central hole of the hub serves as the port for the shaft (the long shaft that joins two wheels) and is located in the center of the bolt circle, a series of five holes that house the bolts to which the nuts join (nuts are the closed nuts that hold the wheel in the car). Brake rotors and hub assemblies rest against the wheel hub; braking action occurs against the wheel to make a car or stop completely. Image racing cars by Goran Bogicevic from Fotolia.com car racing comes in a variety of different types--- but each focuses on specially designed racing cars that compete with each other in different scenarios. Car racing has been around since 1895 and has become one of the most popular sports in the world. Manufactured in Maranello, Italy--Ferrari is one of the most popular racing cars in existence. The Scuderia Scuderia team is a popular participant in the formula one world. In 1993, German racing driver Michael Schumacher drove the Ferrari 412T--- with a Formula One championship--- making Ferrari one of the most successful brands in racing. The company also built cars for other car racing events, such as the A1 Grand Prix series, from 2008 to 2009. They also produced the 599 GTB Fiorano and F430 GT conducted in the GT racing series during other Grand Prix events. Many successful racing cars have been built by Porsche. He produced the legendary Porsche 917 which won two consecutive championships at Le Mans in 1970 and 1971. Porsche 917 also won the Racing Series World Championship, earning 8 of the 10 championships. The Formula One race is considered to be the highest form of car racing sanctioned by the International Federation of L'Automobile. In the 2006 season, the top speeds of Formula One cars were just over 300 km/h. Within the United States --- NASCAR races, such as the Sprint Cup Series and Daytona 5000, are the most popular types of racing. Racing cars used in nasCAR racing have a power spike of around 830 BHP at 9000 RPM, with a maximum torque of 520 pounds per foot. They are rigidly constrained with respect to permitted parts, materials, dimensions, minimum component weights, and other parts. NASCAR racing is typically between 300 and 500 miles long and the design life of an engine for cars ranges up to 800 miles. The cars used in Formula One racing are single-seater racers, usually with custom 2.4L V8s. Ignition and fuel systems are controlled by a systematic and computerized digital engine management system. Weighing at least 95 kilograms, these cars produce a maximum power of around 755 BHP at more than 19,000 RPM and a maximum torque of 214 pounds per foot. Each Formula One racing car has far fewer restrictions compared to NASCAR. By Stephanie Dube Dwilson Racing car mechanics have to stay cool under pressure. If a car breaks down in the middle of a race, the mechanic has to be able to jump, figure out the problem and put the car back on the track as quickly as possible. Racing mechanics are also responsible for keeping these cars running smoothly between races and finding ways to help the car become a bigger contender during the race. Being a racing car mechanic is often a well-paid job, as the annual budget for a racing car team -- including mechanics, body technicians, and engineers -- can exceed \$20 million. Getting a job as a car mechanic racing is a highly competitive effort, so you'll want as many points in your favor as possible. Although there is no particular path to becoming a racing mechanic, obtaining an ASE certification from the National Institute for Automotive Service Excellence is a good way to build your credentials. To pass the ASE exam, you must take a course of study and take the practice tests on the ASE website for \$14.95 each. You they need two years of work experience in the motor vehicle services industry to qualify, or three years for advanced certification. You can replace two years of high school training or complete a mechanics education program with the work experience requirement. Completing professional or technical training is a way to become a racing car mechanic. Schools like WyoTech or NASCAR Technical Institute offer racing car training programs. The WyoTech program lasts nine months and students can choose to specialize in the high-performance powertrain in order to focus on mechanical racing car work. NTI requires students to take not only standard technical training, but also NASCAR-specific courses. Class work and training last 48 to 78 weeks. After getting your degree from this type of training program, you have a better chance of getting a job as a racing car mechanic, especially if someone in the program recommends you. Vocational school is not the right choice for everyone. Some people prefer to be trained at work and build connections through networks. A mechanic who works with Felix Sabates at Chip Ganassi Racing racing stores got his job starting the construction of race cars at home. He worked on small local tracks as a mechanic until he earned a reputation for his good work. After a while, one of the many racing drivers he met through his work recommended him to CGRFS. Another way to get a job as a racing car mechanic is by completing your certification by attending a training program, or working on smaller tracks and then sending your resume online to as many racing car organizations as possible. This method, however, tends to be a harder path than getting a recommendation from someone you've worked with or someone at a mechanics school. CGRFS receives hundreds of resumes and states that very few are selected through this method. Car Bibles are compatible with readers.
