Microsoft Management Consoles have been around since Windows 2000 and are the basis for most GUI configuration tools in Windows Server. If you are a Windows Server administrator, you are already familiar with tools such as Active Directory Users and Computers (ADUC) and Server Manager. Remote Server Administration Tools (RSAT) package these familiar tools for Windows client operating systems. The tools have been built into the Windows server for a long time and do not need to be downloaded. However, until Windows 10 version 1809, you'll need to download the correct RSAT package for your version of Windows, and then install the tools using Control Panel. If you do not know why I am discussing RSAT now that Microsoft is pushing Windows Admin Center (WAC) in the future for graphical user interface management in Windows Server, this is because there are still many tools not available as part of WAC. Especially to manage Active Directory. But in general, WAC is the way forward if you want to use GUI tools for Windows Server management. Learn more about using WAC in Petril: Windows Admin Center – The Future of Windows Server GUI and Getting Started with Windows Central Administration. Install RSAT on Windows 10 RSAT in on-demand Windows 10 Version 1809 and later versions. However, unlike Windows Server and versions of Windows that require manual RSAT downloading, RSAT is installed using Settings instead of control panel. Sign in with your Windows 10 admin account. Open the Settings app by pressing WIN+I. In the Settings app, click Apps. On the Apps and Features screen, click Manage optional features. On the Manage Optional Features screen, click + Add feature. On the Add feature screen, scroll down to the list of available features until you find the RSAT. The tools will be installed separately, so select the tool you want to add, and then click Install. After a few minutes, the RSAT tool you select will be installed on your device. How to install Remote Server Administration Tools in Windows 10 (Image Credit: Russell Smith) install and remove RSAT Using PowerShell You can also install and remove RSAT from Windows using PowerShell. To start, open the PowerShell prompt with local administrator privileges. To see which RSAT tools are installed, use the Get-WindowsCapability: Get-WindowsCapability -Name RSAT* -Online cmdlet Select-Object -Property Name, State To Install All Existing Tools, Pipe Results Get-WindowsCapability add-WindowsCapability: Get-WindowsCapability -Name RSAT* -Online | Add-WindowsCapability – To install individual online tools, use the name of the tool you want to add. You can get the name from the Get-WindowsCapability cmdlet and add it to the add-WindowsCapability as shown here. In this example, I install the Certificate Services tools. Add WindowsCapability Rsat.CertificateServices.Tools ~ ~ ~ 0.0.1.0 -To remove the Online Tool, use Remove-WindowsCapability instead of Add-WindowsCapability: Remove-WindowsCapability -Name Rsat.CertificateServices.Tools ~ 0.0.1.0 -Online How to Install Remote Administration Server Tools in Windows 10 (Image Credit: Russell Smith) Note that The Feature-On-Demand requires Microsoft Update. If Windows Update is configured to use an internal Windows Update server or a System Center Configuration Manager (SCCM) software update point (SUP), you cannot install RSAT without taking additional steps. You must temporarily configure your device to use Microsoft Update or go to Windows Update and select check for updates online. Hi experts, I have Windows 10 Build 2004 , and I need to install RSAT (ADUC , DNS , GPO) on this computer , I do not have internet connection to install it from your computer. So I need rsat offline installation. Please help. Osher, aren't you? I believe that after Windows 1809 the only way to install RSAT tools is to have additional applications and features in Windows settings. If you check out this doc from Microsoft (and scroll to where it says Install, uninstall and turn off / on / RSAT tools you will see where it says it. I have had it fail to install using the direct settings method of selecting the management account. IIRC, there was still MSI available to add RSAT. (I have had to fiddle with it more than once because these great Win10 upgrades always seem to eat RSAT installs I had already in place ...) So how do I get down to rsat? Is there a way to download my home computer and take the installation of my work windows 10? Thanks Why can't you just do it on the internet? Hey spicehead-2z9zt Yes, there is a way to download the RSAT tool, here you go You can download the Server 2016 version of RSAT and it installs. Not all of these computers have an internet connection. When you try to install Ws 2016 RSAT by using an error: An error occurred while installing the installer: 0x8024001d You must go to applications and features and click optional features. then you can add rsat from there. It does not appear under the old insert window features in Control Panel. Something on the list of RSAT. Windows 10 Pro 20H2 I would really like to understand why M\$ decides to eat RSAT with each upgrade and not only that, but change how to get it back.
