## Space runner gamesalad

Community Buy now Download Community Buy now Download Space Runner is the fourth unit in the GameSalad Game Design Curriculum series. The unit introduces various platform game mechanisms such as physics simulation, particle systems, animation control and running, jumping, object collection, and more. Computer science concepts: Optimization: In computer science, optimization is the process of modifying software systems so that some aspects work more efficiently or reduce resources. In general, computer programs can be optimized to run faster or operate in a way that reduces memory usage or other resources. In GameSalad, optimization occurs in the form of reducing the amount of logic used to create an effect. An example of GameSalad's optimization is padding an image on one actor instead of placing many instances of that actor in the scene. This tutorial uses this optimization for block, lava, and spike actors. Looping: In computer programming, a loop is a sequence of commands that continues to repeat until certain conditions are reached. Typically, certain processes are performed, such as getting and changing pieces of data, and some conditions are checked, such as whether the counter has reached the set number. Otherwise, the command sequence is executed repeatedly until the condition is reached. Loops are basic programming ideas that are commonly used to write programs. In GameSalad, you can perform loops using timers, animation actions, or loop actions. Game Salad™ Game Development Curriculum Daniel Burnett, Senior Learning Architect, GameSalad, Inc. Version 2.0 • March 2016 Community Buy now Download In this first coding project (wizard run) you will learn the basics of using GameSalad to produce fantastic games. Library Step Manager Learn Scene Behavior Rules How to post a game on the Game Salad website
