(folder view) Balance in recharge/discharge report Watermaster was to prepare and submit a report to the court on recharging & discharge, safe & operational storage and cumulative effects of shipments in the Chino Aquir tank. Chino Basin Desalter Authority Chino I Expansion and Chino II Desalter Project - July 2004 Progress Report Go Back Shah, T. 2009. An assessment of India's groundwater recharge masterplan. In: Proceedings of the National Workshop on Strategic Issues in Indian Irrigation, New Delhi, 8-9 April 2009. Colombo, Sri Lanka: IWMI. Permanent link to quote or share this item: Shah, Tushaar. 2008. India's Groundwater Rescue Master Plan: an assessment and some proposals for revision. Economic and Weekly, 43(51):41-49. Permanent link to quote or share this point: Government's Groundwater Recharge Master Plan reflects belated recognition of the growing critical groundwater for the Indian economy. The plan aims to raise the post-monsoon groundwater level to three feet below ground level through annual managed artificial recharging? at 36.4 km3 by constructing approximately four million recharging structures of type Rs at a cost of Rs 25,000 crore. Although this is a step in the right direction, the revised master plan under preparation must include socio-economic, institutional and administrative parameters supporting the implementation of any major change intervention. This document provides an assessment of the existing plan and contains proposals for revision. Customer Reviews Share your thoughts with other customersFrag a product review Your newly viewed items and featured recommendations City Chandler hired Carollo in 2003 to develop a masterplan concept for the Chandler Heights Recharge Project and park, which was first revealed to the public in October 2004. A second public meeting was held in December 2005 after more detailed plans were drawn up. The master plan included the development of the area's footprint, integrating the need to recharge recycled water using surface basins. The master plan included an implementation plan and timetable for the development of wetlands recharging facilities, freshwater lake and park facilities through the design and construction phases. The site is part of the Southeast Chandler Area Plan adopted in 1999. The main objective of the project was to develop a recharging site. But the plan also included an important secondary goal of developing an integrated, multi-use park facility that includes education, passive recreation, habitats and trails. The \$22 million park, police substation, and groundwater recharge/wetlands facility were built on 113 acres located on the northeast corner of Chandler Heights and Lindsay Roads. The project's primary purpose is to recharge recycled water headed to the park from the city's airport WRF at McQueen and Queen Creek Roads. Five acres dedicated to police use provide a net of 180 acres for wetlands/recharge and multi-use park development. The wetlands part of the project was developed around groundwater recharge basins and provides recreational opportunities such as wildlife observation, picnicking, cycling, a system, running streams, and a five-acre five-acre Lake. Other services that Carollo included allowing it, programming, preliminary design, final design, and building management services for the city on its wetlands/recharge project in the southeast area of the city. Approval of services included a permit from an underground storage facility (USF), water storage permit (WS) and Arizona Department of Environmental Quality (ADEQ) Aquifer Protection Permit (APP). Master plan for artificial recharging of groundwater in India (2002)This document prepared by the Central Ground Water Board in 2002 after realising the necessity and urgency of ensuring the sustainability of groundwater resources in the critical areas of the country, for various states and EU territories in the country. As per this plan, utilizing monsoon runoff through artificial recharge techniques would be one of the stuck areas in the coming years in the management of groundwater resources. This plan today serves as a planning and implementation document for the various state governments of the country. The document is divided into the following sections:IntroductionNational scenario of groundwaterConstruction of artificial recharging for groundwaterSet for artificial recharging to groundwaterMethodology for the preparation of master planDesign of artificial charging structuresMonitoring mechanismsModal plan for artificial rechargingContent of master plan for artificial recharging Loading to groundwaterDownload the document from below: Critical assessment of the existing master plan and proposals for revisionThis paper published in the Economic and Policy Weekly reflects back on the government's Groundwater Recharge Master Plan (GRMP) and provides a critical assessment of the existing plan and provides some suggestions for revision. The paper argues that the plan is a major step forward in highlighting water priorities in India, and it has made a significant contribution to stressing the importance of groundwater recharge on a massive scale over the investment priorities that continue to favor large surface water structures. But the paper argues that GRMP is questionable as an action plan, which itself deals with hydro-geological details, has nothing to say about the implementation of the plan. The plan is dominated by supply-side thinking and overlooks the demand side of groundwater socio-ecology. The paper argues that the plan allows groundwater recharge the last priority in allocating available runoff in a basin under greatest groundwater stress, as these are most likely to have the least disengaged excess water. This is unsustainable in India, which has come to depend overwhelmingly on groundwater storage for all her needs. Because of this fundamental error, GRMP ends up with a perverse allocation of resources. The paper claims that the plan is completely silent on who will do what, will be the role of government agencies, people, NGOs and civil society institutions; recharging structures and how they will be maintained. Most importantly, GRMP completely ignores the huge recharge potential offered by hard rock India's 11 million excavated wells, which are farmer owned and farmer managed. Managed.
