If you're looking for wallpapers who smart disguise the Galaxy S10, Samsung announced this past Friday a handful of disney and pixar wallpapers. The wallpapers feature characters from Frozen, Their Incredible Zootopia, and Mickey Mouse's animated television show. All of them incorporate the punching point in some way, with the mickey mouse wallpaper hiding it in the mouse's left ear. Olaf turned the puncture short point into one of his buttons. Samsung You can grab the new wallpapers for free in the Galaxy Store app. The initial offering is only for the Galaxy S10 and S10e, with more options coming soon. Samsung did not say whether it will release Disney and Pixar wallpapers compatible with the Galaxy S10 Plus. However, Samsung has said it will expand its current wall options in different collaborations in the near future. Since launching the Galaxy S10 back in February, fans and developers have come up with different ways to creatively use the phone's puncture. An app turns the short hole point into a notification ring, while another turns it into a battery indicator. There's even an app that has long tougher compatible paper from Reddit, if you're not a fan of Samsung's offerings. Tagged: Samsung Samsung Galaxy S10 Wallpapers Samsung's Samsung Galaxy M10 and Galaxy M20 haven't been fully revealed yet, but the wallpapers have already made their way on the internet. SamMobile has posted the Galaxy M10 and Galaxy M20 wallpapers online, and they make for a rather different style compared to the Samsung Galaxy Note 9 images. Unlike hardy swirl galaxy ones' colors, the Galaxy M images are largely mountain-themed (and a desert option too). These images, coming in at 2340 x 2340, don't seem to offer much in the way of OLED-friendly black silk. But they seem like a vibrant departure from their usual colors. Keen on their tougher? Reserve your Galaxy Note 20 Tagged: Samsung Samsung Galaxy Note 20 Wallpapers SmartCam HD is not perfect, but it solidly delivers on its main function of home monitoring. Easy to use, set up quality high quality SD storage images Low-quality audio Choppy Video at Times design top-heavy home-tracking webcams have been around for years, but putting one up often requires some knowledge-how networks. Over time, these surveillance webcams became cheaper and easier to set up, but it wasn't until the Dropcam that consumers took note. Why? Simply because the Dropcam is an affordable solution that's easy to use, come with useful features, deliver quality photos, and take the complicated network out of the picture. Samsung (via its Techwin division) has been doing home-monitoring cams for some time, and just launched its own Dropcam competitors, the SmartCam HD Pro (SNH-P6410BN). It has several of the same features and ease-of-use as the Dropcam Pro, but one-ups it in areas such as storage and resolution. But as a home-monitoring product, can Samsung deliver a product that's in as consumer friendly? Yes, it can, and although it's not a perfect product, it delivers as advertised. Features and design the SmartCam HD Pro (\$190) is the saucer-shaped 2-megapixel camera with an embedded lens registered Full HD (1,920 x 1,080, at 30 frames per second) video, as well as lower resolution like 1,280 x 720 and 640 x 360. In megapixels 2, you won't shoot — high quality still with it, but video is really what you're after. In 10 ounces, it's relatively lightweight to confuse at the base of a wall (although you should also screw it in if you're wall-raising it, as we found out during testing); you could also just rest the camera on a tabletop. The camera is bit larger than the comparable Dropcam, and not as conspiring as we'd like, but we've also seen the bigger camera. If you're looking for a discreet monitoring cam as a form of the determinant, you may not want the SmartCam to be your first choice, but to control your family or pets, it's a solid choice. The SmartCam is no cordin, and there are no battery options, so need to make sure there is a lead nearby if you plan to move it around; The code is relatively long, and there is no need to set the camera after every time you plug-and-unplug. Design wise, the SmartCam is relatively simple. On the front you'll find the camera lenses, speaker (for bi-directional audio, or two-way speakers), LED status lights, and sensors measure lighting conditions (the camera has a night-vision feature that works relatively well in completely dark rooms). Under the unit is a micro SD card slot that allows you to record soutu trees, while the back has a Wi-Fi direct button (it creates a point-to-point connection between your smartphone and the camera, in order to set it up during first use), a reset button (the camera back to factory settings, Gigabit Jack for a hard-wifi connection (Wi-Fi is also available) , audio-out jack, and microphone. Connecting the unit for external speakers might be cumbersome, but if you want to communicate to someone via the SmartCam, it's a good idea as the onboard speakers aren't very loud. As for the wall, Samsung strangely decided to put it on the back of the unit, which made it difficult to take the voice to anyone who speaks back to the camera (more on that later). The design raised some questions, but it's a solid camera. However, you don't really need to take care of what's on or off the camera. While most people get apprehensive about things and networking to the name, this SmartCam is an easy-and-play plug-and-play affair. Once it's powered up, you can set it across your computer's browser or iOS or Android devices. Setting up with a computer is somewhat more involved, as you'll need to first physically connect the camera to your router in order for your computer to get it. If you have a smartphone and home you set up for Wi-Fi, bypass the computer and go straight to your iPhone, iPad, or whatever Android-based device you have, and set up the unit (via the Samsung SmartCam app). This process is far faster and painless, and you'll have your SmartCam set up in no time. (Samsung's has a series of videos on YouTube that demonstrates how to put the camera and mobile app.) More about this in the Performance and Use sections. The SmartCam offers many functions similar to the Dropcam Pro, although it one-ups its competitors (at least on paper) and foremost full HD video recording, SD card seats, and Ethernet port (if you require a hard-wire connection for stability). Otherwise it has a 128-degree wide-angle view (versus 130 degrees Dropcam Pro), Night Vision (there is also a Wide Dynamic Range feature, or back editing, which even exits the brightness due to light entering the room), movement detection, real time alert, digital zoom, and mobile companion apps. What the SmartCam is missing, what Dropcam Pro has, where are they and schedule; The SmartCam stays on forever. Dropcam offers a cloud-based storage as an option. While Samsung doesn't, you can have it slim a photo and send it to your Google Picasa account every time it detects movement. If you want video files, pop a high-capacity SD card in there, and it can record footage continuously (delete recordings earlier once it maxes out the card), or you can manually record a scene via the app. We think the SD card is a great selling point on the Dropcam, but if someone breaks into your home and steals the camera, then all your content will get stolen too. To view footage, or make adjustment settings, you can either use a web browser (Mac or PC) or the Android app. The menus are relatively straightforward and, except for a few features, are easy to figure out. We used both the iOS and Android apps, and found them to be exactly the same. You'll need to first create a Samsung SmartCam account, and then you can register the camera (or multiple cameras). Overall, we were able to get our test unit set up and running in no time. Whether it's a web browser, iPhone 5S, iPad, or Samsung Galaxy S5, we had no problem entering the camera and watching footage. Now let's now take a look at how well it actually does. What's in the packet's box comes with the camera, power adapter, network (Ethernet) cable, a quick-start guide with other documents, dual-sided tape, and screws and ink. The full manual can be downloaded via the Samsung SmartCam website, but you don't really need it unless you want to use some of the most advanced features. The SmartCam comes with a standard one-year warranty, but it doesn't protect against accidents. Performance and use while Samsung's SmartCam HD Pro is perfectly designed, it manages to deliver on most of its promises as a home-monitoring device. The form factor and limited mount options raise some questions, but it's a solid camera that can beam live footage from your home (or wherever you've got it hooked up) to the computer, smartphone, or tablet screen of your choice. Overall performance is impressive, and image quality is very good and impressive low-light performance. We tested the SmartCam in two different situations: one, as a surveillance camera kept tabs on an apartment, and two, to observe a dog in another apartment while she's at home alone during the day. Other possible uses could be to observe your children and their souls or elderly parents at home alone, or records that are happening at a party you're dropping off. As mentioned, setup is a relatively smooth process, whether you are using a PC, smartphone, or tablet. In both environments, we use our smartphones to handle the setup process because it's faster and less complicated. We simply connect the camera to, create an account in the app, and The screen instructions pair the camera. Simple. The camera's overall performance is impressive, although we still see choppy videos each time the current has been placed in its highest quality videos. This might be a problem with the bandwidth in your home or wherever you've been set up. In observing our dog, turning to Plesanth-hogging devices on the camera's local network helps, but we've never been able to get a reliable video stream of work during that part of the test. Lower quality environment works great, with only occasional occasional video. In the apartment-monitoring environment, video performance is also generally great, except the few times where we couldn't log in at all; we suspect it was a question with the network, by the camera, since we were able to log in later. So before we blame the camera entirely, we must also consider network speed as well. If you have a reliable and fake internet connection, the camera should do well. With that said, the wide-angle image quality is very good and beautiful coloring, and we were quite impressed by the low-light (or lack of night performance) night vision. Movement is also nice and smooth. Is it really True HD? Is it as good as camera having sensors stronger and more megapixels? No, but to look at small sizes on your computer or smartphone, it's perfectly fine. For the most basic use — monitoring your home — it works really well if all you want to do is check on things. But there are more advanced features. The SmartCam Pro HD is equipped with features such as night vision, zoom, and motion detection, all of which can be accessed using any of the internet or mobile apps. There are some inconsistency, however. The two-way talk feature doesn't seem to be accessible

via the web app, only the mobile app. Even on a laptop with a built-in microphone (we use an Air MacBook), there isn't an option to talk through the camera. We also found the sound quality to be low quality and sometimes hard to hear, unless we call out loud or have in a noise truck in the street. We love a fun feature on the mobile app that lets you play music in those who speak the camera, either to entertain a crying child (or, in our case, a sleep dog) or to wake someone out of bed (or, again, a sleep dog). Another cool feature is that you can see in the camera from multiple devices simultaneously, without any handles. The movement detection also works well – almost too well. In our apartment surveillance test, we received an alert on our phone that something triggered the camera; sure enough, we take a dig room to a jar change for laundry quarters. However, particularly at night, the sensors were so sensitive that it must have picked up the tiniest movements, such as a puff curtain or shade moving across the room, because our phone phones up and alert – enough to you think someone will break into your home. A bigger problem is the SmartCam form factor. While overall it's lightweight, it's rather head-heavy, causing it to be prudent on easily if it's not guaranteed to a surface. The landslide case included adhesives can be posted to the base, and it provides stability when the camera is standing right, but there is no warning to the document that the scotch is not strong enough to serve as a mountain wall (screws are included for this setup). We learned this first thing when the plot was issued out and the camera fell to the floor; fortunately, the SmartCam is a solid device. (We should remember that Samsung includes screws and ink for ride walls.) No damage, internal or external, from the fall of 5-foot fall on a linoleum floor. Conclusion If you've got a pet or a kid that you'd like to have a live-feed from when not at home, Samsung's SmartCam HD Pro is a great option. Wide-angle lenses capture a large chunk of the room than you might expect, and a built-in SD slot card even allows for video capture – a better option than to-pay cloud-based storage. If you need a true security monitoring camera, there are better (albeit more expensive) options and pan-tilt-swivel functions, but for basic home monitoring needs or peace of mind, the SmartCam does the job. It's not perfect, and – based on our time and it – the HD capabilities are mostly in-name-only, but the camera otherwise works as published, and comes with a robust feature package accessible to both Web and mobile apps.
